Section 01

Executive Summary

Eight tools were evaluated through direct repository inspection: README analysis, file structure exploration, skill/workflow content review, release history tracking, and community metrics assessment. Each repository was classified by its actual function rather than its marketing. These tools span fundamentally different categories—comparing a design skill to a workflow framework to a task orchestrator requires acknowledging those distinctions.

USE CASE	RECOMMENDATION
Best overall choice	Superpowers
Best for beginners	Claude Skills
Best for power users	Superpowers
Best for long / complex projects	Get Shit Done (GSD)

USE CASE	RECOMMENDATION
Best for structured / spec-driven workflows	Get Shit Done (GSD)
Best for autonomous loop workflows	Ralphy
Best for domain expertise injection	Claude Skills
Best for UI/UX design generation	UI/UX Pro Max Skill
Best for comprehensive all-in-one setup	Everything Claude Code
Best for plugin catalog & learning	Plugins Plus Skills

Ecosystem update: GSD has expanded with **GSD-2**, a companion 27-document knowledge base on building coding agents—covering error classification, degradation detection, and agent design patterns synthesized from multiple LLM providers.

Author's Pick

Superpowers would be my first install. It changes how the agent *thinks*, not just what it does. The anti-rationalization architecture and TDD enforcement produce measurably better code. Then add **Claude Skills** as a complementary expertise layer. For long projects, add GSD. For UI-heavy work, add UI/UX Pro Max. The key insight: these tools occupy different layers and the best setup combines 2–3, not all 8.

Section 02

Tool Profiles & Classification

These eight tools occupy fundamentally different categories. Ralphy is an external orchestrator wrapping AI CLIs. UI/UX Pro Max is a single-domain design skill. Plugins Plus Skills is a marketplace/distribution platform. Understanding these distinctions is critical—comparing them as if they are all "plugins" would be misleading.

METHODOLOGY FRAMEWORK

71.3K

STARS

5,489

FORKS

13

SKILLS

3

COMMANDS

v4.3.1

VERSION

4

PLATFORMS

An opinionated software development methodology delivered as composable skills. Enforces brainstorming before implementation, TDD (no production code without a failing test), systematic debugging, and rigorous code review. The distinguishing innovation is its **anti-rationalization architecture**—systematically pre-empting the 12+ ways AI agents skip processes.

- + Battle-tested methodology (17 months, 71K community)
- + Zero config—session-start hook auto-loads methodology
- + Cross-platform: Claude Code, Cursor, Codex, OpenCode
- + Exceptional documentation depth per skill
- Prescriptive workflow (can't skip phases easily)
- No orchestration loop or parallel execution
- Windows support is fragile (6+ documented fixes)

ORCHESTRATION FRAMEWORK

24.7K

STARS

2,110

FORKS

12

AGENTS

32

COMMANDS

v1.22.4

VERSION

35

WORKFLOWS

A multi-agent orchestration framework purpose-built to fight **context rot**—the quality degradation as Claude's context window fills during long sessions. Uses a lean orchestrator (~10-15% context) that dispatches subagents with fresh 200K-token windows. Features wave-based parallel execution, goal-backward verification, Nyquist test validation, and atomic git commits. Now accompanied by **GSD-2**, a 27-document companion knowledge base called "Building Coding Agents" synthesized from Claude, GPT, Gemini, and Grok.

- + Context engineering solves a real problem (context rot)
- + Full project lifecycle coverage (32 commands)
- + Wave-based parallel execution with dependency awareness
- + Goal-backward verification (checks results, not claims)
- + GSD-2 knowledge base—27-doc "Building Coding Agents" guide (error taxonomy, degradation detection, agent patterns)
- Steep learning curve (32 commands to discover)
- Rapid churn risk (22 releases in 2 weeks, 258 open issues)
- Overkill for simple tasks

Compound Engineering

by EveryInc (Kieran Klaassen)

PLUGIN + WORKFLOW + CLI

9.9K

STARS

783

FORKS

29

AGENTS

22

COMMANDS

v2.34

VERSION

20

SKILLS

A dual-purpose project: the **Compound Engineering plugin** (plan → work → review → compound methodology) and a **cross-platform CLI converter** that translates Claude Code plugins into formats for 10 other AI tools. The philosophy: each unit of work should make subsequent work easier. Includes a full-auto `/lfg` pipeline and swarm orchestration.

- + Cross-platform converter (10 AI tools)—unique capability
- + Institutional knowledge capture (compound-docs skill)
- + Deepest feature set (29 agents, 22 commands, 20 skills)
- + Context7 MCP integration for live documentation lookup
- Rails/Ruby bias in review agents
- Large context footprint (48KB swarm skill alone)
- Single-maintainer dominated (71% of commits)

REFERENCES

v0.4.9

VERSION

12

DOMAINS

The broadest knowledge-injection system: 66 specialized skills across 12 domains (languages, frameworks, infrastructure, security, data/ML). Uses **progressive disclosure**—compact SKILL.md files (~80 lines) with deep reference files (100-600 lines each) loaded on demand for token efficiency. Also includes a 5-phase project workflow and "Common Ground" assumption-surfacing system.

- + Widest domain coverage (66 skills, 12 domains)
- + Token-efficient progressive disclosure architecture
- + Multi-agent support (11 AI coding tools)
- + "The Fool" critical thinking / devil's advocate skill
- Pre-1.0 maturity (v0.4.9)
- No orchestration or execution engine
- Primarily solo contributor (89% of commits)

Ralphy

by Michael Shimeles

AUTONOMOUS TASK RUNNER

2.5K

STARS

313

FORKS

8

ENGINES

5

TASK FORMATS

v4.7.2

VERSION

10+

CONTRIBUTORS

A standalone CLI that orchestrates AI coding agents in an autonomous loop until a PRD is fully implemented. Supports 8 AI engine backends (Claude, Codex, Copilot, Gemini, etc.), 5 task source formats (Markdown, YAML, JSON, GitHub Issues), parallel execution with git worktrees or sandboxes, and automatic branch/PR creation. Named after Ralph Wiggum.

- + Simplest mental model: `ralphy --prd PRD.md`
- + Engine-agnostic (8 AI backends)
- + Parallel execution with sandbox isolation
- + Auto branch/PR creation via gh CLI
- Runs with `--dangerously-skip-permissions`
- Zero quality guardrails (no TDD, no review)
- Bad PRDs produce bad code at machine speed

Everything Claude Code

by Affaan Mustafa (affaan-m)

COMPREHENSIVE PLUGIN SYSTEM

50K+

STARS

6K+

FORKS

58

SKILLS

13

AGENTS

v1.7.0

VERSION

35

COMMANDS

A comprehensive, **battle-tested productivity system** built on 10+ months of intensive daily production use. Includes 58 skills, 13 specialized agents (planner, architect, TDD-guide, security-reviewer), 35 commands, a mature hook system (992 internal tests), multi-language rules architecture (TypeScript, Python, Go, Swift), and security-first design with AgentShield integration.

- + 992 internal validation tests—most thoroughly tested option
- + Security-first: AgentShield integration, 1,282 security tests
- + Multi-language rules (common/ + language-specific/)
- + Continuous learning: auto-extracts patterns from sessions
- "Kitchen sink" risk—58 skills + 35 commands can overwhelm
- Hook debugging is opaque (10-second timeouts, silent failures)
- Node.js dependency for hooks and scripts

Plugins Plus Skills

MARKETPLACE + LEARNING HUB

by Jeremy Longshore

1.5K

STARS

182

FORKS

315

PLUGINS

1,537

SKILLS

v4.15

VERSION

15

TUTORIALS

The largest single-repo Claude Code marketplace: **315 plugins across 20+ categories** with 1,537 validated agent skills. Includes a CLI package manager (CCPI), 15 Jupyter notebooks, 11 production playbooks (~53,500 words), 7 MCP servers, and 42 SaaS integration packs. Best treated as a **browsable catalog + learning resource** rather than an all-at-once install.

- + Largest catalog (315 plugins, 1,537 skills, 20+ categories)
- + Exceptional educational content (playbooks, tutorials, reference impl.)
- + CCPI CLI for search/install/validate
- + Production patterns with test harness and empirical verification
- Quality varies across 315 plugins (some are formulaic templates)
- Discoverability challenge in 17,524-file, 132MB repo
- No quality ratings or user review system

UI/UX Pro Max Skill

DESIGN INTELLIGENCE SKILL

by nextlevelbuilder

37.3K

STARS

3,641

FORKS

68

UI STYLES

96

PALETTES

v2.2.3

VERSION

18

PLATFORMS

A **single-domain design intelligence skill** that generates production-ready design systems from natural language. Contains 68 UI styles, 96 color palettes, 57 font pairings, 100+ reasoning rules, and 13 tech stack guides. Uses a **BM25 search algorithm** across CSV databases to match product categories to design decisions. Supports 18 AI assistants via [uipro-cli](#).

- + 100+ reasoning rules teach Claude *why* design choices work
- + 8-tier priority framework (accessibility → style selection)
- + Zero Python dependencies—stdlib only, runs offline
- + Saves 2-4 hours per design system vs. manual creation
- Single-domain: zero value for non-UI/UX work
- Windows symlink issues (open issue #109)
- CSV data ceiling—no database backend for scale

Classification Matrix

Split into two tables for readability. All eight tools compared on the same dimensions.

DIMENSION	SUPERPOWERS	GSD	COMPOUND ENG.	CLAUDE SKILLS
Category	Methodology Framework	Orchestration Framework	Plugin + Workflow + CLI	Skills Pack
Claude Code Fit	Native	Native	Native	Native
Setup	Low	Low	Low	Low
Learning Curve	Medium	High	Med-High	Low
Maintenance	Active	Very Active	Very Active	Active
Best For	Process discipline	Complex multi-phase projects	Cross-platform power users	Domain expertise

DIMENSION	EVERYTHING CC	UI/UX PRO MAX	PLUGINS+SKILLS	RALPHY
Category	Comprehensive Plugin	Design Intelligence	Marketplace + Hub	Autonomous Runner
Claude Code Fit	Native	Native	Native	External
Setup	Low-Med	Low	Low-Med	Low
Learning Curve	Medium	Low	Med-High	Low
Maintenance	Active	Active	Active	Moderate
Best For	Standardized team workflows	Design system generation	Plugin catalog + learning	Fire-and-forget automation

Section 04

Deep Comparison

Each criterion is assessed with a named winner, explanation, and trade-offs.

Ease of Installation TIE: SUPERPOWERS / COMPOUND / CLAUDE SKILLS

All three are 2-line marketplace installs with zero configuration. GSD is close (`npx get-shit-done-cc@latest` , needs Node 16.7+). Ralphy is `npm install -g ralphy-cli` but operates externally to Claude Code. No clear loser—all are under 2 minutes to install.

Time-to-Value WINNER: SUPERPOWERS

Install it, start a session, and your agent immediately follows better processes. No commands to learn, no configuration, no project setup. Skills auto-trigger when relevant.

Runner-up: Claude Skills—skills auto-trigger based on keywords.

Trade-off: GSD and Compound Engineering require learning their command vocabulary before seeing real value. Ralphy requires writing a PRD first.

Quality of Workflows WINNER: GSD (BREADTH) / SUPERPOWERS (DEPTH)

GSD has the most comprehensive command set (32 commands covering the entire project lifecycle). Superpowers has the deepest individual skills—the `systematic-debugging` skill alone is a masterclass with 4 phases, anti-rationalization tables, and shell scripts.

Trade-off: GSD's breadth means you'll never use most commands. Superpowers' depth means the workflow is rigid.

Update: GSD-2 adds portable quality patterns on top—error taxonomy with deterministic fast paths for syntax errors and flaky-test quarantine to prevent autonomous loops from burning iterations on non-deterministic failures.

Context Management & Long-Session Reliability WINNER: GSD

This is GSD's raison d'être. Lean orchestrator (~10-15% context) dispatches subagents with fresh 200K-token windows. Context monitor hook warns at 35% usage, goes critical at 25%. STATE.md provides cross-session memory.

Runner-up: Superpowers addresses this via subagent-driven development but doesn't monitor context usage.

Trade-off: For sessions under 30 minutes, vanilla Claude Code is probably fine.

Update: GSD-2 codifies degradation detection patterns—trending difficulty and hot-file signals—that catch soft quality deterioration before hard-stall circuit breakers trigger.

Planning / Spec / Execution Structure WINNER: GSD

Full pipeline: `/gsd:new-project` → requirements → roadmap → `/gsd:plan-phase N` → `/gsd:execute-phase N` → `/gsd:verify-work N` → `/gsd:complete-milestone` . Includes Nyquist validation (test coverage mapped to requirements before coding) and goal-backward verification.

Runner-up: Compound Engineering with `ce:plan` → `ce:work` → `ce:review` → `ce:compound` .

Trade-off: GSD's structure is heavy. A 20-minute feature doesn't need phases and milestones.

Flexibility & Customization WINNER: CLAUDE SKILLS

66 skills across 12 domains means composing exactly the expertise needed. Progressive disclosure keeps token costs manageable. No locked-in workflow—skills activate based on what you're actually doing.

Trade-off: Flexibility means less enforcement. Claude Skills won't stop you from skipping tests or planning.

Cross-Platform Portability WINNER: COMPOUND ENGINEERING

The CLI converter supports 10 AI coding tools (OpenCode, Codex, Copilot, Gemini CLI, Kiro, Windsurf, etc.) with `bun run convert --to <target>` and live sync. No other project comes close.

Runner-up: Claude Skills (11 agents via Agent Skills spec). Ralphy wraps 8 backends from the opposite direction.

Trade-off: Conversion fidelity is imperfect—features relying on Claude Code-specific constructs may not translate.

Documentation Quality WINNER: SUPERPOWERS

RELEASE-NOTES.md is a multi-thousand-word document covering every version with technical rationale, breaking changes, and migration paths. Each skill is a standalone teaching document with anti-patterns, red flags, and rebuttal tables.

Trade-off: The README understates the project's depth—the real documentation lives inside skill files.

Community Traction WINNER: SUPERPOWERS

TOOL	STARS	FORKS	AGE
Superpowers	71,341	5,498	~17 months
Everything CC	50,000+	6,000+	~16 months
UI/UX Pro Max	37,340	3,641	~15 months
GSD	24,700	2,110	~15 months
Compound Eng.	9,893	783	~17 months
Claude Skills	4,919	311	~17 months
Ralphy	2,517	313	~2 months
Plugins+Skills	1,513	182	~5 months

Trade-off: Stars don't equal quality. GSD has more workflow sophistication despite 3× fewer stars. Plugins+Skills' low count belies its massive catalog (1,537 skills).

Release Cadence WINNER: GSD (FASTEST)

22 releases in 2 weeks. Compound Engineering has daily commits. Superpowers releases less frequently but more deliberately.

Trade-off: GSD's velocity is a double-edged sword. Rapid releases mean rapid fixes but also potential breaking changes and instability.

Risk Profile LOWEST: SUPERPOWERS / HIGHEST: RALPHY

Lowest risk: Superpowers—pure markdown, no runtime dependencies, no state files, no external tools required, massive community, proven over 17 months.

Highest risk: Ralphy—runs agents with `--dangerously-skip-permissions`, no methodology enforcement, bad PRDs produce bad code at high speed.

Hidden risk: GSD—258 open issues, rapid churn, file-based state can drift, known bugs with agent type recognition.

Section 05

Honest Reality Check

Genuinely Useful vs. Mostly Hype

Genuinely Useful

Superpowers—the anti-rationalization patterns and TDD enforcement produce measurably different agent behavior. The 71K stars aren't just hype; the methodology fundamentally changes how Claude approaches tasks.

GSD—for its target use case (complex, multi-phase projects). Context engineering solves a real problem. GSD-2 extends the ecosystem further with portable agent-building patterns (error classification, degradation detection, assumption tracking) that are useful even outside the GSD tool itself. But it's heavy machinery for simple tasks.

Claude Skills—as a knowledge layer. If you're working with a specific framework and want deep expertise injected, this delivers.

Everything Claude Code—the hook system and security infrastructure represent real engineering. 992 tests backing it up is evidence, not marketing. 10+ months production use.

UI/UX Pro Max—for its domain, genuinely saves 2-4 hours per design system. The 100+ reasoning rules are real intellectual property, not prompt wrapping.

Useful with Caveats

Compound Engineering—the core `ce:plan/work/review/compound` loop is solid and the cross-platform converter is unique. But the Rails/Ruby-specific agents reduce universality, and the `/lfg` full-auto pipeline is risky—a bad plan cascades through execution, review, and PR creation.

Plugins Plus Skills—the educational content (playbooks, Jupyter notebooks) is top-tier. But 1,537 skills of varying maturity means quality is inconsistent; many follow a formulaic 5-phase template. Best treated as a learning resource + selective catalog.

Ralphy—does exactly what it promises (autonomous PRD-to-code loops). But "fire and forget" AI coding with permissions bypassed is inherently risky, and it provides zero quality guardrails.

Too Much Process Overhead?

Overkill Warning

GSD for simple projects: 32 commands, phases, milestones, roadmaps, state files. A 20-minute feature doesn't need `/gsd:new-project` → 5 commands → `/gsd:complete-milestone`.

Compound Engineering for quick fixes: 22 commands, 6-phase planning, swarm orchestration. The `orchestrating-swarms` skill alone consumes 48KB of context.

Superpowers is the lightest of the "heavy" options, but the enforced brainstorming step before every creative task can feel slow for trivial changes.

Common Failure Modes

TOOL	KNOWN FAILURE MODES
Superpowers	Agent still finds ways to skip brainstorming or TDD despite anti-rationalization patterns. Ongoing "arms race" documented across 6+ versions.
GSD	Planning document drift (#956). Agent type recognition lost after <code>/clear</code> (#949). Phantom AskUserQuestion answers (#950). Rapid version churn. <i>GSD-2 mitigates some concerns by documenting best practices for error handling and degradation detection, though runtime issues remain tool-level.</i>
Compound Eng.	Context7 MCP may not auto-load. Windows incompatibility with <code>ce:*</code> under OpenCode (#226). Agent namespace mismatch (#199).
Ralphy	Bad PRDs → bad code at scale. No guardrails. Mistakes happen fast and silently under <code>--dangerously-skip-permissions</code> .

TOOL	KNOWN FAILURE MODES
Claude Skills	Skills may not trigger reliably if keyword detection doesn't match phrasing. Pre-1.0 maturity. Namespace restructuring pending (v0.5.0).
Everything CC	Information overload: 58 skills + 35 commands + 13 agents = "where do I start?" Hook debugging painful (silent 10-second timeouts). Overlapping skill advice possible.
UI/UX Pro Max	Edge-case bugs in design system generation (#160). Windows symlink path failures (#109). Western-centric design patterns—no RTL language support.
Plugins+Skills	Installing many plugins at once bloats context. Quality variance across 315 plugins. Formulaic 5-phase templates in some skills. 132MB repo is unwieldy to browse.

When to Use Vanilla Claude Code

The Honest Truth

Vanilla Claude Code with a well-written CLAUDE.md is enough for 70%+ of daily coding work.

Use it when: your task takes under 15 minutes, you're doing exploratory work, you have a clear specific instruction, you're an experienced developer with strong process habits, or you don't want any overhead.

These tools add value at the margins—the 30% of work that is complex, multi-session, or requires process discipline the agent wouldn't naturally exhibit.

Section 06

Recommendations by Scenario

"I want to ship features fast with minimal setup"

Use: Claude Skills (or Superpowers + vanilla Claude Code)

Claude Skills installs in 30 seconds, skills activate automatically, zero workflow to learn. Superpowers adds process discipline on top. For simple features, vanilla Claude Code is often enough.

"I want highly structured PRD/spec-driven development"

Use: [Get Shit Done \(GSD\)](#)

No competition. GSD has the deepest spec-driven pipeline: requirements → roadmap → phase planning → execution → verification → milestone completion. The Nyquist validation layer ensures test coverage maps to requirements before any code is written.

"I want reusable skills and specialized expertise"

Use: [Claude Skills](#)

66 skills across 12 domains with progressive disclosure architecture. The broadest knowledge injection available. Pair with Superpowers for process discipline on top of domain expertise.

"I want autonomous / loop-based execution"

Use: [Ralphy \(simplicity\)](#) or [GSD \(quality\)](#)

Ralphy is the simplest autonomous loop: write a PRD, run `ralphy --prd PRD.md`, walk away. GSD provides autonomous execution too (`/gsd:execute-phase`) but with more guardrails. If quality matters more than simplicity: GSD. If you trust your PRD and want maximum autonomy: Ralphy.

"I want a stable daily driver for real coding work"

Use: [Superpowers](#) + [Claude Skills](#)

Superpowers provides engineering methodology (TDD, debugging, review). Claude Skills provides domain expertise (framework patterns, best practices). Zero overlap—they complement perfectly. Both are low-risk, low-overhead installs.

"I need rapid design system generation"

Use: [UI/UX Pro Max Skill](#)

The only design-focused skill in this evaluation. 68 UI styles, 96 color palettes, 100+ reasoning rules. Generates production-ready design systems from natural language in seconds. Layers safely onto any other tool since it only activates for design tasks.

"I want a comprehensive all-in-one setup"

Use: [Everything Claude Code](#)

58 skills, 13 agents, 35 commands, hook system with 992 tests, multi-language rules. Best for teams wanting standardized, security-first workflows. Invest time upfront to learn what's available—the "kitchen sink" rewards those who explore it.

Section 07

Combining Tools

Some tools complement each other without overlap. Others conflict. Here are the safe combinations.

Best Combination: Superpowers + Claude Skills

Superpowers handles:

Process discipline (TDD, planning, debugging, code review), workflow enforcement, anti-rationalization patterns, verification before completion

Claude Skills handles:

Domain expertise (React patterns, Kubernetes ops, SQL optimization, security review, etc.), framework-specific best practices, progressive knowledge injection

Why this works

Zero overlap. Superpowers doesn't provide domain knowledge; Claude Skills doesn't provide process enforcement. They complement perfectly. Superpowers ensures the agent follows good practices while Claude Skills ensures it has the right expertise for the technology being used.

Alternative: Superpowers + GSD (complex projects)

Superpowers handles:

Methodology enforcement, TDD, debugging methodology, code review quality standards

GSD handles:

Session orchestration, context management, phase planning/execution, cross-session state

Safe Add-on: UI/UX Pro Max

UI/UX Pro Max can layer onto *any* combination above. It only activates for design tasks and occupies no shared workflow space. If you do frontend work, add it freely—it won't conflict with Superpowers, GSD, Claude Skills, or any other tool.

Conflict Warning

Both Superpowers and GSD have opinions about planning workflows. Superpowers forces brainstorming before implementation; GSD has its own `/gsd:plan-phase` flow. **Test this combination before relying on it.**

Do NOT combine: Superpowers + Compound Engineering simultaneously—both try to enforce their own workflow, and session-start hooks may conflict.

Do NOT combine: Everything Claude Code + Plugins Plus Skills—massive context bloat from overlapping skills and potential conflicting advice.

Section 08

Final Ranking

1 Superpowers

82% confidence

Best risk/reward ratio. Proven methodology, massive community (71K stars), zero config, works for 90% of use cases. The anti-rationalization architecture is a genuine innovation. Docked 18% for lacking orchestration/parallelism and mandatory brainstorming overhead.

2 Get Shit Done

78% confidence

Most sophisticated engineering. Best for complex projects where context rot and multi-session work are real concerns. GSD-2 strengthens the ecosystem with codified agent-building knowledge—error taxonomy, degradation signals, and assumption tracking—useful even independently. Docked 22% for steep learning curve, rapid churn risk, and being overkill for simple tasks.

3 Claude Skills

76% confidence

Lowest friction, most immediately useful, excellent domain depth (66 skills, 12 domains). The best complement to any workflow tool. Docked 24% for being pre-1.0, lacking process enforcement, and no orchestration.

4 Everything Claude Code

70% confidence

Most comprehensive single package. Genuine 10+ months production battle-testing. 992 tests, security-first design, multi-language rules. Docked 30% for "kitchen sink" overwhelm risk, hook debugging opacity, and Node.js dependency.

5 UI/UX Pro Max

68% confidence

Best-in-class for its domain: 68 styles, 96 palettes, 100+ reasoning rules, BM25 search. Genuinely saves hours on design systems. Hard ceiling: single-domain only. If you're backend-only, this drops to irrelevant.

6 Compound Engineering

65% confidence

Best cross-platform story (12+ AI tools) and deepest feature set. The compounding knowledge loop is unique. Docked 35% for Rails/Ruby bias, single-maintainer risk, large context footprint, and [/lfg](#) autonomous pipeline risk.

7 Plugins Plus Skills

58% confidence

Largest catalog (315 plugins, 1,537 skills) with exceptional educational content. Best as a learning resource + selective catalog. Docked 42% for quality variance, discoverability issues, and formulaic skill templates.

8 Ralphy

45% confidence

Genuinely novel concept: autonomous PRD-to-code loops across 8 engines. Could leapfrog others with maturity. Docked 55% for zero quality guardrails, permissions bypass, ~5% test coverage, and the risk of bad PRDs at machine speed.

Ranking Assumptions

This ranking assumes:

1. **You're primarily using Claude Code** (not Cursor/Codex/OpenCode)—if cross-platform is your #1 priority, Compound Engineering moves up.
2. **You value code quality over speed**—if pure speed/autonomy matters most, Ralphy or GSD move up.
3. **You're a solo developer or small team**—for large teams, GSD's milestone/phase system or Everything CC's standardized workflows may matter more.
4. **Your projects are general-purpose**—if you're a Rails shop, Compound Engineering's agents are a major advantage. If you do heavy frontend/design work, UI/UX Pro Max jumps significantly.
5. **You want curated quality over catalog volume**—if you prefer browsing and cherry-picking, Plugins Plus Skills moves up.

Choose wisely. Build better.

The best tool is the one that matches your actual workflow, not the one with the most stars.
